EARTH LEAKAGE RELAYS

According to IEC/EN 60947-2 Annex M

Introduction

• **NETWORK MONITORING AND PROTECTION**

The electronic residual current relays allow monitoring and protection of the low voltage distribution network through the use of a toroidal transformer.

• **CARRYING OUT THE PROTECTION**

Thanks to the residual current relays it is possible to measure the leakage current to earth.

These relays work in conjunction with a separate external toroid.

The active conductors that pass through the toroid create a magnetic field proportional to the current flow. Under normal conditions and in the absence of leakage current, the vector sum of the current is zero.

Any fault condition causes an unbalance in the vector sum proportional to the value of the leakage current.

The value of the fault current is constantly detected by the toroid:
when the residual current relay receives a signal from the toroid,
it switches its output contacts. Then the shunt-trip opens the circuit breaker.

EARTH LEAKAGE RELAYS

Compliance to IEC/EN 60947-2 Annex M

The features and benefits

● ADJUSTING SENSITIVITY AND TRIPPING TIMES

The sensitivity $I_{\Delta n}$ can be set from 0.03 to 30 A while the tripping times from 0 to 5 seconds, thus ensuring flexibility for many applications.

● ALARM

If the alarm function is ON, the alarm contact switches when the fault current exceeds 60% of the threshold $I_{\Delta n}$ selected.

● FAIL SAFE

The new range of ELR residual current relays allows, through a selector switch, to enable or not the fail safe function.

If Fail safe is OFF, the relay activates the shunt-trip once the fault current is detected and also when there is no connection between the relay and toroid.

If Fail Safe is ON, the relay activates the shunt-trip also when there is lack of supply to the residual current relay.

The Fail Safe prevents the line from not being protected when there is no auxiliary power to the device.

● REMOTE RESET

The output contacts of the ELR residual current relays can be reset remotely, using push-buttons.

● AUTORESET

When the fault will be removed from the network, the relay contacts will switch automatically, without the need to press the reset button from a local or remote position.

● FREQUENCY FILTERING

This feature makes the relay stronger in presence of currents with harmonic components that are not due to an effective fault in the circuit but they are typically caused by the presence of electronic filters (e.g. when using frequency converters driving motors).

● FAULT MEMORY

The fault memory turns on in case of a fault and is only resettable manually. In this way it is possible to know if the relay has tripped even if the fault is no longer present and the contacts have returned into the standard position thanks to the autoreset.

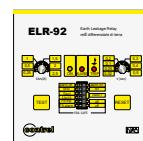

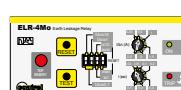

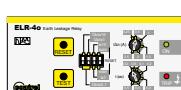

● DIGITAL DISPLAY

The digital display allows instant reading of the value of earth leakage current. It is possible, through a minidip, to block the display on the residual current value that has generated the intervention of the circuit breaker.

ELR - 7

EARTH LEAKAGE RELAY - FLUSH-MOUNT VERSION DIN 48x48 mm

GENERAL CHARACTERISTICS

- Earth leakage relay type A
- Configurable fail safe operation
- Green power LED indicator (ON)
- Red relay tripped LED indicator (TRIP)
- Front TEST and RESET buttons
- Configurable automatic or manual resetting
- Flush mount 96x96mm housing with transparent cover
- Degree of protection: IP20 terminals, IP40 on front with cover.

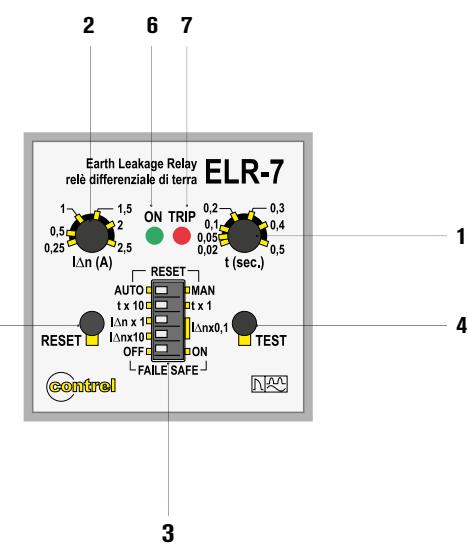

ORDER CODE	RATED AUXILIARY SUPPLY VOLTAGE	OUTPUTS CONTACTS	WT [kg]
ELR-7 48	24-48 VAC/DC	2	0,112
ELR-7 240	110 VAC/DC-240 VAC	2	0,112

OPTIONS	
T	Tropicalisation
F	Built-in filter for 3rd harmonic

ADJUSTMENTS	
Configurable tripping set-point ($I_{\Delta n}$)	0,025...0,25A 0,25...2,5A 2,5...25A 25...250A (with external multiplier CT1-M)
Configurable tripping delay time (t)	0,02...0,5s 0,2...5s

LEGENDA	
1	Tripping delay time adjustment
2	Fault current to earth adjustment

2	6	7	1	Dip switches settings: 3a - auto reset (A) - man reset (M) auto reset = automatic reset man reset = manual reset through RESET key on the front. For remote resetting, simply shut off the auxiliary supply for about 1 second
5			2	3b - tx10 - tx1 constant selection for tripping delay time adjustment. Examples: positioning the dip switch on tx10 and the potentiometer on 0.3 we will have a tripping delay upon exceeding the $I_{\Delta n}$ threshold of $0.3 \times 10 = 3$ seconds; positioning the dip switch on tx1 and the potentiometer on 0.3 we will have a tripping delay upon exceeding the $I_{\Delta n}$ threshold of $0.3 \times 1 = 0.3$ seconds
			3	3c - $I_{\Delta n}x0,1$ - $I_{\Delta n}x1$ - $I_{\Delta n}x10$ constant selection for fault current to earth adjustment. The constants in relation to the position of the 2 dip switches are the following: • dip switch position $I_{\Delta n}x0,1$ and $I_{\Delta n}x0,1$ K = 0,1 • dip switch position $I_{\Delta n}x1$ and $I_{\Delta n}x0,1$ K = 1 • dip switch position $I_{\Delta n}x1$ and $I_{\Delta n}x10$ K = 10
			4	3d - fail safe off - fail safe on Fail safe off = positive safety deactivated. Output relay normally deenergised Fail safe on = positive safety activated; in this condition the output relay is normally energised; therefore in the event of the lack of auxiliary voltage the output contacts move to the tripping condition.
			5	TEST key. Causes tripping of the relay.
			6	RESET key. To reset the relay after tripping. For remote reset, simply shut off the auxiliary supply for about 1 second.
			7	ON LED. Indicates the presence of auxiliary voltage.
				TRIP LED. Lighting up indicates the cutting in of the TRIP relay due to exceeding the $I_{\Delta n}$ set.

For remote resetting, simply shut off the auxiliary supply for about 1 second 3b - tx10 - tx1 constant selection for tripping delay time adjustment. Examples: positioning the dip switch on tx10 and the potentiometer on 0.3 we will have a tripping delay upon exceeding the $I\Delta n$ threshold of $0.3 \times 10 = 3$ seconds; positioning the dip switch on tx1 and the potentiometer on 0.3 we will have a tripping delay upon exceeding the $I\Delta n$ threshold of $0.3 \times 1 = 0.3$ seconds 3c - $I\Delta n_{x0,1}$ - $I\Delta n_{x1}$ - $I\Delta n_{x10}$ constant selection for fault current to earth adjustment. The constants in relation to the position of the 2 dip switches are the following: • dip switch position $I\Delta n_{x0,1}$ and $I\Delta n_{x0,1} K = 0,1$ • dip switch position $I\Delta n_{x1}$ and $I\Delta n_{x0,1} K = 1$ • dip switch position $I\Delta n_{x1}$ and $I\Delta n_{x10} K = 10$
4	TEST key. Causes tripping of the relay.
5	RESET key. To reset the relay after tripping. For remote reset, simply shut off the auxiliary supply for about 1 second.
6	ON LED. Indicates the presence of auxiliary voltage.
7	TRIP LED. Lighting up indicates the cutting in of the TRIP relay due to exceeding the $I\Delta n$ set.
8	TRIP MEMORY (versions ELR-m4o, ELR-m4v) Mechanical trip relay indicator for exceeding the $I\Delta n$ set. It stores the indication also in the lack of auxiliary voltage. The flag indicator resetting can only be made with the RESET button.

ADJUSTMENTS

Configurable tripping set-point ($I_{\Delta n}$)	0.025...0.25A 0.25...2.5A 2.5...25A 25...250A ((with external multiplier CT1-M))
Configurable tripping delay time (t)	0.02...0.5s 0.2...5s.
Prealarm set-point	70% fisso (ELR-92 only)

LEGENDA

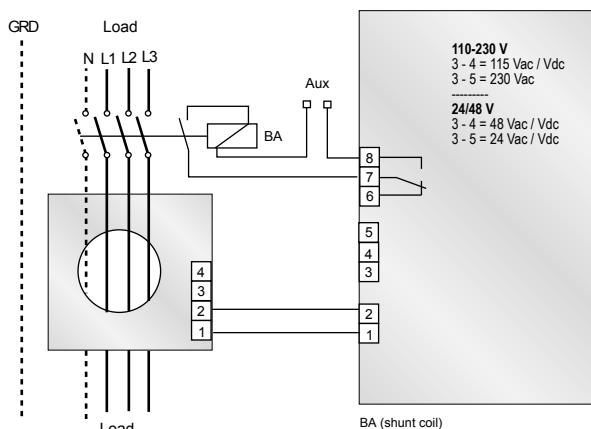

- 1** Tripping delay time adjustment
- 2** Fault current to earth adjustment
- Dip switches settings:
 3a - Version ELR-92 auto reset (A) - man reset (M)
 auto reset = automatic reset
 man reset = manual reset through RESET key on the front. For remote resetting, simply shut off the auxiliary supply for about 1 second
 Version ELR-91 alarm off - alarm on
 alarm on = trip prealarm activated; upon reaching 70% of the set $I_{\Delta n}$ rate, LED ALARM lights up and signal contact changeover takes place. Upon exceeding the set $I_{\Delta n}$ rate LED TRIP will light up and the TRIP contacts will change over
 3b - tx10 - tx1 constant selection for tripping delay time adjustment.
 Examples: positioning the dip switch on tx10 and the potentiometer on 0.3 we will have a tripping delay upon exceeding the $I_{\Delta n}$ threshold of $0.3 \times 10 = 3$ seconds; positioning the dip switch on tx1 and the potentiometer on 0.3 we will have a tripping delay upon exceeding the $I_{\Delta n}$ threshold of $0.3 \times 1 = 0.3$ seconds
 3c - $I_{\Delta n}x0.1 - I_{\Delta n}x1 - I_{\Delta n}x10$ constant selection for fault current to earth adjustment. The constants in relation to the position of the 2 dip switches are the following:
 • dip switch position $I_{\Delta n}x0.1$ and $I_{\Delta n}x0.1$ K = 0.1
 • dip switch position $I_{\Delta n}x1$ and $I_{\Delta n}x0.1$ K = 1
 • dip switch position $I_{\Delta n}x1$ and $I_{\Delta n}x10$ K = 10
 3d - Version ELR-92 FS trip - off
 FS trip = positive safety activated on TRIP relay; in this condition the TRIP relay (terminals 7-8-9) is normally energised; therefore in the event of the lack of auxiliary voltage the output contacts move to the tripping condition (TRIP).
 Off = positive safety deactivated. TRIP relay normally deenergised.
 3e - Version ELR-92 FS alarm - off
 FS alarm = positive safety activated on ALARM relay, in this condition the prealarm relay ALARM is normally energised; therefore in the event of the lack of auxiliary voltage the output contacts move to the trip condition (TRIP).
 Off = positive safety deactivated. ALARM relay normally deenergised.
- 4** TEST key. Causes tripping of the relay.
- 5** RESET key. To reset the relay after tripping. For remote reset, simply shut off the auxiliary supply for about 1 second.
- 6** ON LED. Indicates the presence of auxiliary voltage.
- 7** TRIP LED. Lighting up indicates the cutting in of the TRIP relay due to exceeding the $I_{\Delta n}$ set.
- 8** ALARM LED (versions ELR-92); lighting up depends on the dip switch programming; see the instructions of point 3a).

EARTH LEAKAGE RELAY - FLUSH-MOUNT VERSION DIN 96x96 mm

LEGENDA

1	Tripping delay time adjustment
2	Fault current to earth adjustment
	Dip switches settings:
3a	- alarm off - alarm on alarm off = trip prealarm deactivated; upon exceeding the set $I\Delta n$ rate, output contact changeover takes place and LEDs ALARM and TRIP light up. alarm on = trip prealarm activated; upon reaching 70% of the set $I\Delta n$ rate, LED ALARM lights up and signal contact changeover takes place. Upon exceeding the set $I\Delta n$ rate LED TRIP will light up and the TRIP contacts will change over
3b	- tx10 - tx1 constant selection for tripping delay time adjustment. Examples: positioning the dip switch on tx10 and the potentiometer on 0.3 we will have a tripping delay upon exceeding the $I\Delta n$ threshold of $0.3 \times 10 = 3$ seconds; positioning the dip switch on tx1 and the potentiometer on 0.3 we will have a tripping delay upon exceeding the $I\Delta n$ threshold of $0.3 \times 1 = 0.3$ seconds
3c	- $I\Delta n_{x1}$ - $I\Delta n_{x10}$ - $I\Delta n_{x10}$ constant selection for fault current to earth adjustment. The constants in relation to the position of the 2 dip switches are the following: • dip switch position $I\Delta n_{x1}$ and $I\Delta n_{x10} K = 0.1$ • dip switch position $I\Delta n_{x1}$ and $I\Delta n_{x10} K = 1$ • dip switch position $I\Delta n_{x1}$ and $I\Delta n_{x10} K = 10$
3d	- FS trip - off FS trip = positive safety activated on TRIP relay; in this condition the TRIP relay (terminals 7-8-9) is normally energised; therefore in the event of the lack of auxiliary voltage the output contacts move to the tripping condition (TRIP). Off = positive safety deactivated. TRIP relay normally deenergised.
3e	- FS alarm - off FS alarm = positive safety activated on ALARM relay, in this condition the prealarm relay ALARM is normally energised; therefore in the event of the lack of auxiliary voltage the output contacts move to the trip condition (TRIP). Off = positive safety deactivated. ALARM relay normally deenergised.
4	TEST key. Causes tripping of the relay.
5	RESET key. To reset the relay after tripping. For remote reset, simply shut off the auxiliary supply for about 1 second.
6	ON LED. Indicates the presence of auxiliary voltage.
7	ALARM LED. Lighting up depends on the dip switch programming; see the instructions of point 3a)
8	TRIP LED. Lighting up indicates the cutting in of the TRIP relay due to exceeding the $I\Delta n$ set.
9	TRIP MEMORY (versions ELR-8mVtcs) Mechanical trip relay indicator for exceeding the $I\Delta n$ set. It stores the indication also in the lack of auxiliary voltage. The flag indicator resetting can only be made with the RESET button.
10	4-digit display (versions ELR-8V, ELR-8mVtcs) for viewing the differential current.
	Display setting dip switches (versions ELR-8V, ELR-8mVtcs)
11a	hold on - hold off Earth leakage current display mode. hold on = the rate displayed is the one read in real time and the leakage current rate that caused tripping is kept on the display.
11b	hold off = the rate displayed is the one read in real time (the rate that caused tripping is not kept on the display).
	11b) 20A-200A 20A = display scale to 19.99A 200A = display scale to 199.9A
12	TCS LED (versions EKR-8tcs, ELR-8mVtcs). The indicator switches on when TCS control protection trips. This protection is used to monitor the trip shunt circuit operation when connected through the current shunt coil.

ELR-1 D

EARTH LEAKAGE RELAY - MODULAR VERSION 1 MODULE

GENERAL CHARACTERISTICS

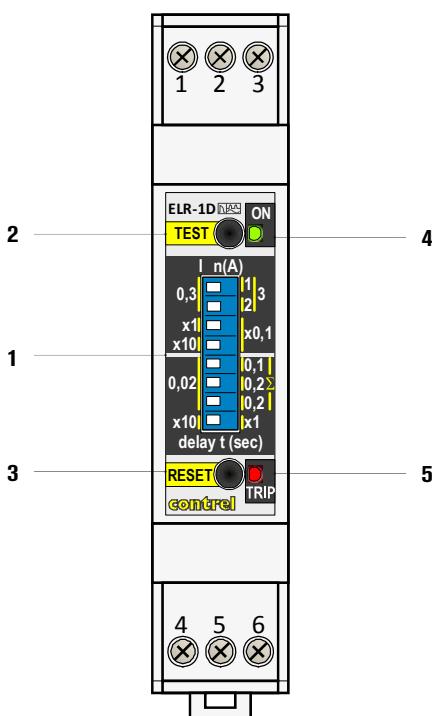

- Earth leakage relay type A
- External toroidal
- Green power LED indicator (ON)
- Red relay tripped LED indicator (TRIP)
- Front TEST and RESET buttons
- Modular DIN housing, 1 module, with transparent cover, suitable for fixing on 35mm DIN rail (IEC/EN 60715)
- IEC degree of protection: IP20 terminals, IP40 on front with cover.

EARTH LEAKAGE RELAY - MODULAR VERSION 6 MODULES (PUBLIC LIGHTING)

LEGENDA

- 1** Tripping delay time adjustment
- 2** Fault current to earth adjustment
- Dip switches settings:
 - 3a** - auto reset (A) - man reset (M)
auto reset = automatic reset
man reset = manual reset through RESET key on the front. For remote resetting, simply shut off the auxiliary supply for about 1 second
 - 3B** - tx10 - tx1 constant selection for tripping delay time adjustment.
Examples: positioning the dip switch on tx10 and the potentiometer on 0.3 we will have a tripping delay upon exceeding the $I\Delta n$ threshold of $0.3 \times 10 = 3$ seconds; positioning the dip switch on tx1 and the potentiometer on 0.3 we will have a tripping delay upon exceeding the $I\Delta n$ threshold of $0.3 \times 1 = 0.3$ seconds
 - 3C** - $I\Delta n_{x0,1}$ - $I\Delta n_{x1}$ - $I\Delta n_{x10}$ constant selection for fault current to earth adjustment. The constants in relation to the position of the 2 dip switches are the following:
 - dip switch position $I\Delta n_{x0,1}$ and $I\Delta n_{x0,1} K = 0.1$
 - dip switch position $I\Delta n_{x1}$ and $I\Delta n_{x1} K = 1$
 - dip switch position $I\Delta n_{x10}$ and $I\Delta n_{x10} K = 10$
 - 3D** - Version ELRC-BL 6r - 3r selection for self-reclosing attempts
6r = 6 self-reclosing attempts
3r = 3 self-reclosing attempts
- 4** TEST key. Causes tripping of the relay.
- 5** RESET key. To reset the relay after tripping.
For remote reset, simply shut off the auxiliary supply for about 1 second.
- 6** ON LED.
Indicates the presence of auxiliary voltage.
- 7** TRIP LED.
Lighting up indicates the cutting in of the TRIP relay due to exceeding the $I\Delta n$ set.
- 8** ALARM LED (version ELD-L2m)
Lighting up depends on the dip switch programming; see the instructions of point 3a)
- 9** TRIP MEMORY (version ELD-L2m) Mechanical trip relay indicator for exceeding the $I\Delta n$ set. It stores the indication also in the lack of auxiliary voltage.
The flag indicator resetting can only be made with the RESET button.
- Built-in current transformer.
Hole diameter 28mm. It must be crossed by the cables of the line to be controlled; insert the phases and neutral if present.
The earth cable must NOT cross the current transformer
- 10**

ELRC-1

EARTH LEAKAGE RELAY - COMPACT INTERNAL PANEL VERSION WITH INCORPORATED TOROIDAL TRANSFORMER

The ELRC-1 have the particularity that they are manufactured with the built-in Toroidal Transformers. They are specially conceived for those applications, in which the space saving is an advantage (for example, in **MOTOR CONTROL CENTERS**, **BATTERIES OF DISTRIBUTION**, etc.). Although its reduced dimensions, the relay has as wide setting ranges as the other ELR's series.

GENERAL CHARACTERISTICS

- Earth leakage relay type A
- Incorporated toroidal 35-60-80-110 mm standard diameter
- Green power LED indicator (ON)
- Red relay tripped LED indicator (TRIP)
- Front TEST and RESET buttons
- Configurable automatic or manual resetting
- Compact housing for fixing on panel mounting plate
- IEC degree of protection: IP20 terminals.

TOROIDAL CURRENT TRANSFORMERS

GENERAL CHARACTERISTICS

The differential earth relays CT-1 can be connected to the following toroidal current transformers.

They must be crossed by the cables of the line to be controlled;

insert the phases and neutral if present.

The earth cable must NOT cross the current transformer.

NOTE: Twist the connection wires between the toroid and the relay, keep them away from the power cables, and in the presence of strong electromagnetic fields use a shielded lead.

Separately twist the pair of signal cables (terminals 1-2)

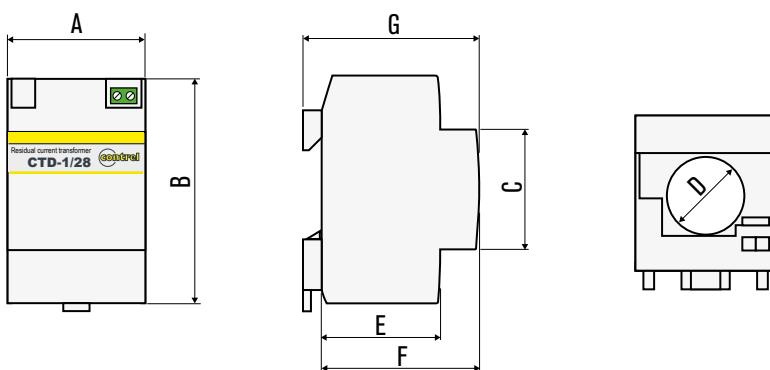

from the control circuit pair (terminals 3-4) where present.

Reduce the distance between the toroid and the relay to the minimum.

CT-1M EXTERNAL MULTIPLIER TOROIDAL

Toroidal multiplier to extend the current calibration of differential relays up to 250 A.

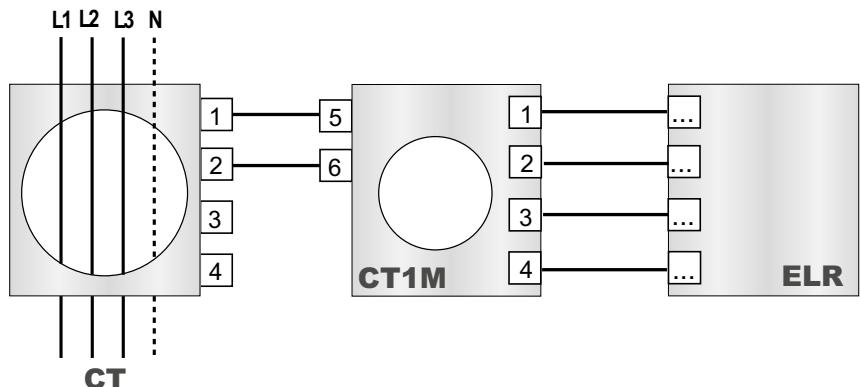

To connect between toroid and relay.

Reduces the current 10 times. Therefore, the range of the tripping set-point $I_{\Delta n}$ adjustment is multiplied by 10.

CONNECTIONS

Input terminals 5-6 of the multiplier must be connected respectively to terminals 1-2 of the toroid transformer on the controlled line.

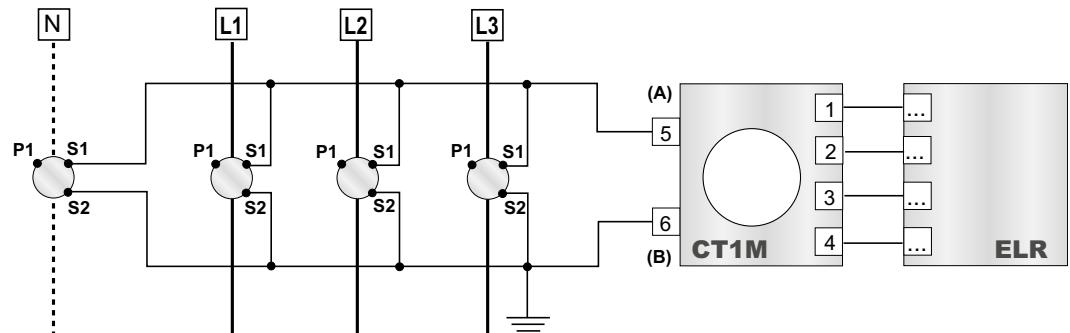

N.B. No cables must pass through the external multiplier.

CT-1S EXTERNAL ADDDER TOROIDAL

Toroidal adder to be used in cases where the conductors of the system to be protected exceed the inside diameter of the reducer.

In this case they are used CT /5A to be installed in line, which will be then connected to the toroid adder and from there to the differential.

CT-1 / APPLICATION NOTE

TOROIDAL CURRENT TRANSFORMERS

1. APPLICATION THROUGH CT

1.1. APPLICATION - This application is particularly useful in those cases, in which it is impossible to embrace all conductors (supply bars) of the system, with only one transformer. In this case, it is possible to have Earth Leakage Protection, by using Ct's and one of our special toroid transformers (exclusively made by us, based on the winding rate of the Ct's), complying with the wiring diagram, described below.

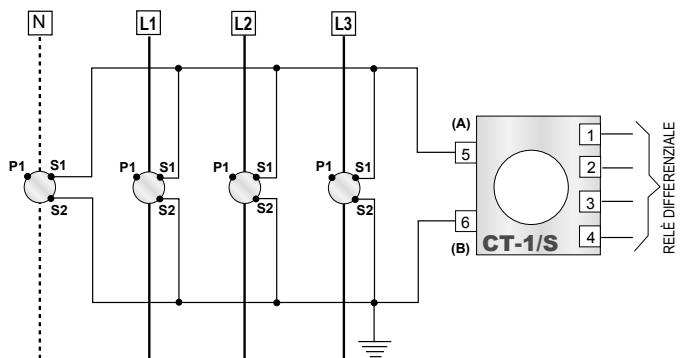

For this application the Ct's should have: the same transformation ratio (5A secondary), same power (10 VA at least) and class 0,5.

On the other hand, it is important that the Ct's are mounted, in such a way that the script P1 is orientated upstream, towards the line to be protected, and the various secondaries exactly as per the diagram.

2. OPERATING - When there is no earth leakage, the vectorial addition of the currents sensed by the Ct's, is equal to zero. Thence, there is no current flowing in the windings related to our terminals 5 and 6 (in our special toroid). There isn't any voltage generated in our terminals 1 and 2 therefore, which should make the ELR to trip.

When there is a leakage, otherwise, the vectorial addition of the currents sensed by the Ct's is different to zero.

Thence, a voltage is generated through the terminals 1 and 2, making the ELR to trip. For this application, it is advisable to have a tripping threshold of the ELR, not lower than a 1/100 of the rated current of the system to be protected.

2. APPLICATION WITH TRANSFORMERS GROUND

2.1. APPLICATION - This application is particularly indicated when the system is supplied through Transformers, working in parallel. In fact, it could be impossible to protect the line with ELR's sited immediately downstream of the transformers. Since it wouldn't be possible to establish which part of the Current Leakage to Ground (clg) is borne by one or the other transformer. This brings us to a point, in which is practically impossible to establish exactly the threshold of the tripping value of the relays.

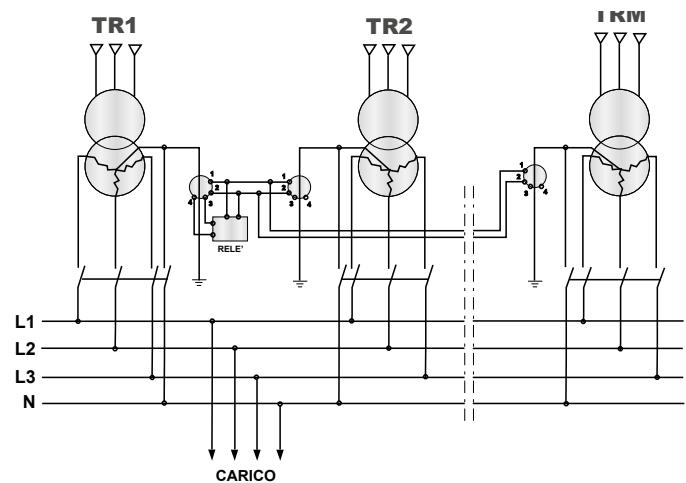

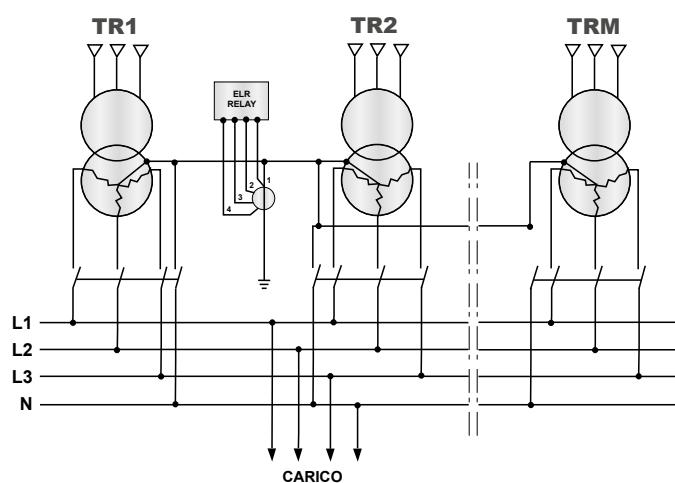

EXAMPLE: Suppose that we wish to protect an installation, which requires that the ELR should trip when the clg is equal to 5A. Should we install 2 ELR's with 5A threshold, it would certainly be required a higher value of clg, in order to make the ELR to trip. On top of the above, in case of an equal distribution of the current leakage between both transformers, it should be required a clg = 10A, in order to make the ELR's to trip. Otherwise, if we adjust the tripping threshold to 2.5A, it could be the case that one transformer is bearing fl of the clg and the other/only. Thence the ELR of the first transformer would trip before the 5A of clg are reached. Other factor to be considered,

is the eventual separation of a transformer from the parallel, during low load demand periods. In this case the eventual clg is totally re-closed through the earth of an unique transformer and the tripping threshold should be establish exactly as 5A, under these conditions. The solution of the problem is given in our diagram.

2.2. OPERATING - Our diagram here below shows the solution, based in connecting the star centres of both transformers together to earth with an unique wire, which has passed through our toroidal transformer before.

It is based in the fact that any current leakage to ground can't be re-closed but through the star centres of the transformers. With the toroidal, positioned as per our diagram, it is measured therefore the total current leakage to ground.

Back to the above mentioned example, we should establish as 5A the tripping threshold value, with the assurance that the ELR will trip, when the clg goes above the 5A threshold.

CT-1 / APPLICATION NOTE

TOROIDAL CURRENT TRANSFORMERS

3. APPLICATION ON VARIOUS LINES IN PARALLEL

3.1. APPLICATION - This application can be used whenever there are various connecting lines through two bar systems OMNIBUS.

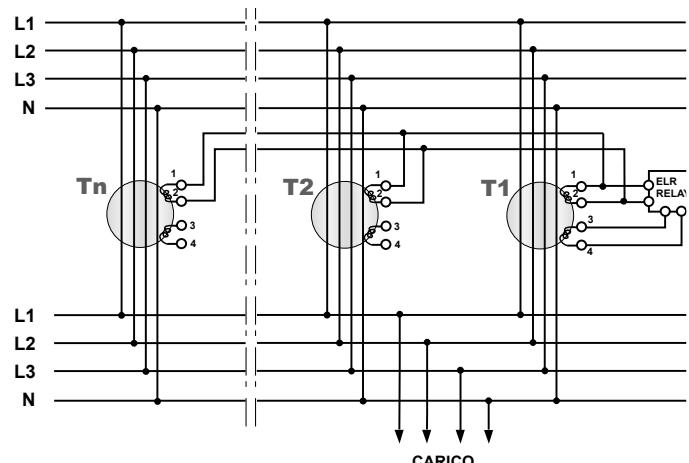

In this case, the use of ELR's with their corresponding T/T's, per each connecting line, it could give operation inconveniences; since the vectorial addition of the currents, on each connecting line, might not necessarily be equal to zero.

It could be the case that, with 2 perfectly equal lines, there could be a difference of current distribution, due to a contact resistance difference (in phase R, for example), whilst the adsorbed current by the load might be equally distributed, in the other lines. All this brings along that, there might be a leakage signal, at the toroidals terminals 1-2, which could be sufficient to make the ELR's to trip, without any earth leakage. With this kind of distribution, it is advisable to go to the wiring diagram, in which there are used as many T/T's as connecting lines, all of them orientated towards the 1 and 2 terminals of our ELR.

3.2. OPERATING - when there is no leakage, although with a non uniform current distribution, as mentioned in the above paragraph 3.1, the originated signal at the first toroidal, is totally void by the leakage signal originated at the second toroidal, since the signal can't be but in opposition, and the ELR's terminals won't receive any signal and the ELR won't trip therefore.

Otherwise, when there is an earth leakage, independently of whatever it might be the current distribution, the signals summation, being measured by the various T/T's, meet at the 1 and 2 terminals of the ELR, which will trip therefore.

This application is valid for a maximum of 6 Tt's connected in parallel. In those cases, in which a higher number might be required., it is advised to contact us. For this application, it is advisable to have a tripping threshold not below 1/1000 of the nominal current of the system to be protected.

4. MEDIUM VOLTAGE LINES

Should an ELR be used in MV lines, it is advisable to use the built-in filter for third harmonic version.

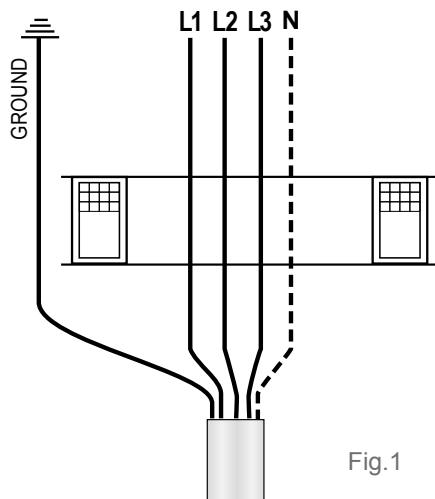

Fig.1

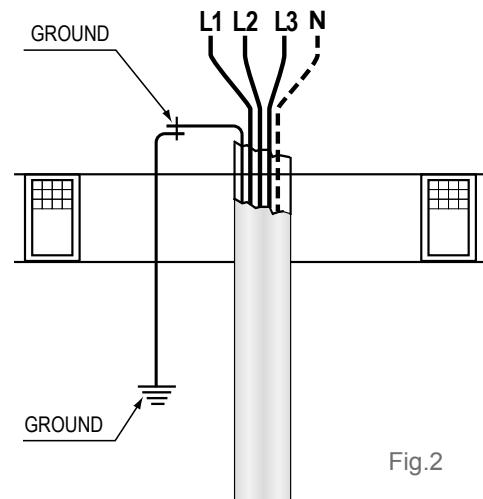

Fig.2

NOTE If there is an earthing circuit, it should be placed outside of the T/T (fig1).

When the cable is fitted with a metallic screen and it gets through the T/T, the earthing connection should be as (fig. 2).

RSR-72

AUTO RESTART MOTORS RELAY

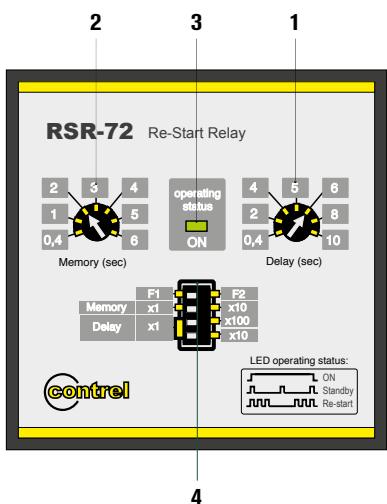

The RSR-72 type relay for re-start and reacceleration is designed to perform the automatic motor restarting, after control and protection device opening, as a consequence of a momentary line voltage interruption or drop-out.

The RSR-72 relays allow, after the stop of the motors, the automatic re-start with a correct sequence depending of the working process.

The RSR-72 relays are housed in a case for flush mounting or panel mounting or on DIN rail 35 mm on extractible undecal socket type. On front panel there are potentiometers and micro-switches for settings and one LED to indicate the functional status.

ORDER CODE	RATED AUXILIARY SUPPLY VOLTAGE
RSR-72	For applications with the control device of the contactor with contact impulsive position.
RSR-72A	For applications with device contactor control with a maintained contact.
RSR-A72B	For applications with the control device of the contactor with contact impulsive position with special mode of the memory count.
OPTIONS	
F	Tropicalisation
Z	Undecal support
M	Restraint spring for fixing undecal support

GENERAL CHARACTERISTICS

The RSR-72 relay is used in association with an holding position contact.

Otherwise from the RSR-72, **the RSR-72A maintains the contact closed after the restarting the motor/contactor.**

On the relay is possible to set a memory time from 0.2 to 60 seconds and a delay time from 0.2 to 1000 seconds.

Anytime a voltage lack (or with a value less of 65% of the rated voltage) and subsequently the voltage restores (at least the 90% of the rated voltage) within the memory time set the re-start motor output will be activated after the delay set.

If the voltage restores after the memory time, the automatic re-start will not happen, while the voltage restores in a time less than 0.2 seconds (the minimum memory time), the motor will reaccelerate.

If the reacceleration function is activated and the voltage go back in a time less than 0.2 seconds (maximum time for reacceleration) the motor will reaccelerate immediately, if the reacceleration function is not activated after the delay time the motor will restart automatically.

- **SUPPLY CIRCUIT AND VOLTAGE CONTROL**
- **CIRCUIT OF CONTACTOR CONTROL AND OF MEMORY ACTIVATION WITH SEPARATION BY PHOTO-COUPLER**
- **CIRCUIT OF MOTOR STOP CONTROL BY PA PUSHBUTTON (STOP) AND QUICK MEMORY SHUTDOWN SEPARATED BY PHOTO-COUPLER.**
- **CIRCUIT FOR FINAL RELAY CLOSING AND CONTROL CIRCUIT ARE MANAGED BY MICROPROCESSOR**

LEGENDA

1	Tripping delay time adjustment
2	Regolazione tempo di memoria
LED OPERATING STATUS.	
3	OFF = power supply and measure voltage are not present ON = relay in normal voltage measurement within the expected range SLOW = relay in stand-by, the voltage lack for a time greater than the time memory, the restart is not executed even if the supply voltage is present. FAST = relay in restart, the voltage lack has been for a time less than memory time, after the delay time set the re-start will be done
4	

DIP SWITCHES SETTINGS:

- 4a** – F1 - F2 reacceleration function
F1 = acceleration deactivated
F2 = acceleration activated

- 4b** – x1 - x10 constant selection for memory time adjustment.
Examples: positioning the dip switch on x10 and the potentiometer on 3 we will have a memory time of $3 \times 10 = 30$ seconds; positioning the dip switch on x1 and the potentiometer on 3 we will have a memory time of $3 \times 1 = 3$ seconds

- 4c** – x1 - x10 - x1000 constant selection for tripping delay time adjustment. The constants in relation to the position of the 2 dip switches are the following:

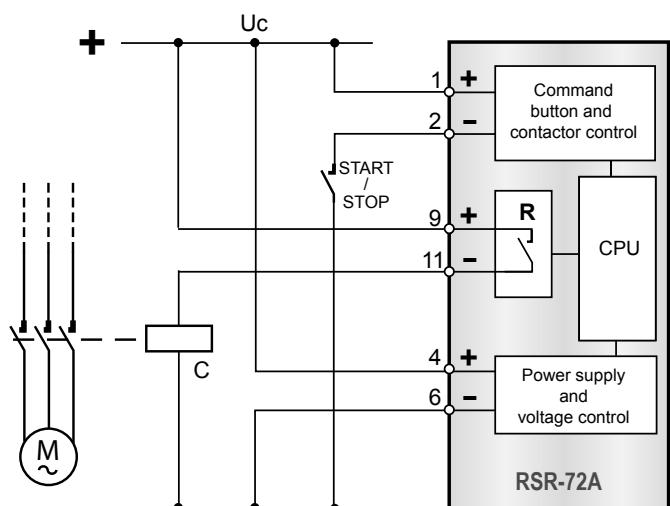

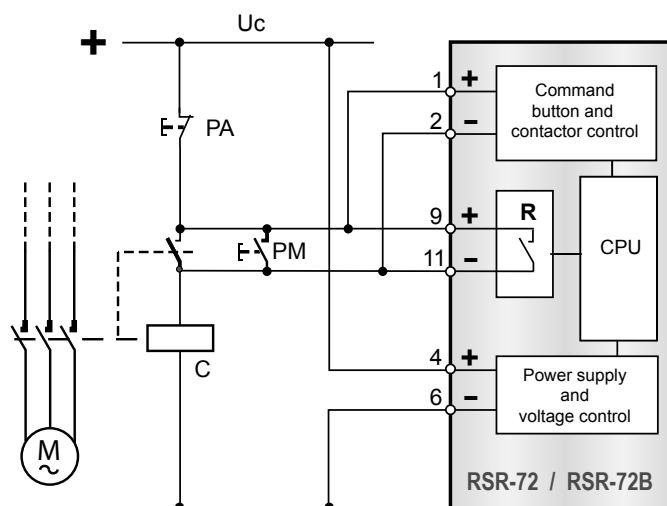

- dip switch position x1 and x1 K = 1
- dip switch position x1 and x10 K = 10
- dip switch position x1 and x100 K = 100

RSR-72

AUTO RESTART MOTORS RELAY

OPERATING

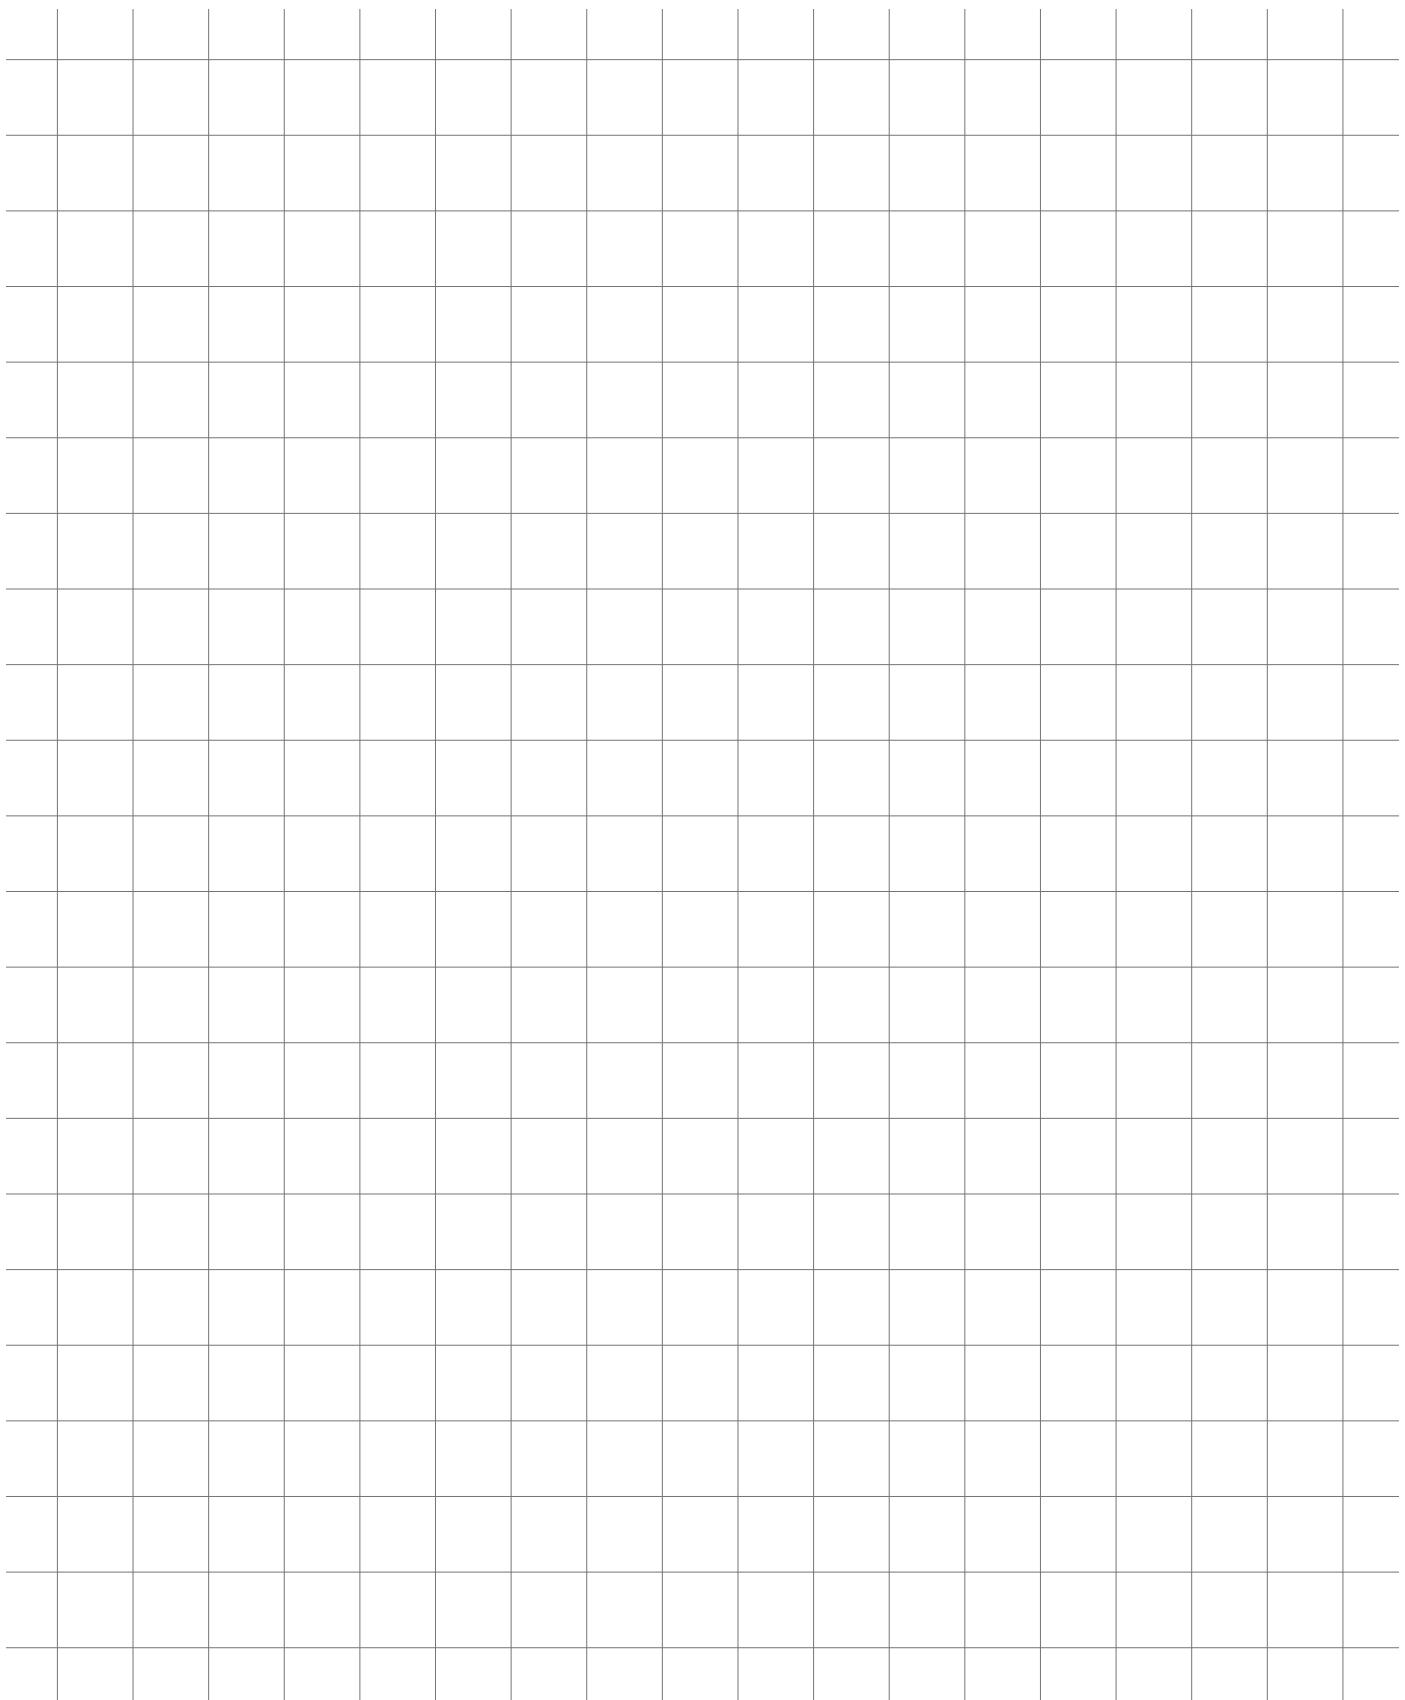

When the voltage is under the threshold of the 65% of the rated voltage, for the RSR-72 relay is a voltage lack. When the voltage restores over the threshold of the 90% of the rated voltage, for the RSR-72 the voltage is ok.

1. With power supply, the RSR-72 relay is in STAND-BY way and the LED blink with rate 1/1.
In this way if the voltage go under the threshold value, no operation of restart is performed.
2. Pressing the PM button (START)
 - the contactor is energized and self-retained by its auxiliary contact
 - the motor starts , the "R" contact is open
 - the memory circuit inside the RSR-72 relay is activated
 - RSR 72 go in ON position, signalled by the led also fixed in ON position
3. In case of temporary voltage lack:
 - 3a. if voltage is OFF for a time longer of the MEMORY time set:
 - the motor remain out of service and the contactor is de-energized
 - the "R" contact is open
 - the RSR 72 go in STANDBY mode, and the led blink at rate 1/1
 - 3b. If voltage is OFF for a time in the range from 0.2 seconds and the MEMORY time fixed:
 - the contactor is de-energized, the RSR-72 relay is in RE-START mode and the LED blink with rate 1/3 beginning the count of the DELAY time set
 - elapsed the delay time, the "R" contact switch in closed giving the pulse to restart, in this way the contactor is energized and the motor restart
 - next the RSR 72 go in ON mode, signalled by the led fixed to ON
 - Version RSR-72B: start to count the MEMORY time when the first power lack happen from condition as in point 2) (motor is running).
More cycles of power lack and power restore can happen during MEMORY time count, with consequently starting of DELAY time before activate R contact);
if before the R contact can re-close another power lack happen, anyway the MEMORY time continue to allow another retry to restart the motor if power will restore;
but if the MEMORY count is all elapsed and restart is not happened, the RSR-72B go in condition as in point 3a)
 - 3c. if the voltage is OFF for a time smaller of 0.2 sec. with reaccelerate function not activated (F1)
 - the functioning is the same of the b) item
 - 3d. if the voltage is OFF for a time smaller of 0.2 sec. with reaccelerate function activated (F2)
 - the contactor is de-energized, when the voltage restores the RSR-72 relay active immediately the reaccelerate of the motor, the "R" contact switch in closed giving the pulse to reaccelerate.
4. Pressing the "PA" push-button (STOP)
 - 4a. the contactor-switch is de-energized, the motor stops
 - 4b. the memory circuit inside the RSR-72 relay is deactivated
 - 4c. the "R" contact is open and the motor automatic restart does not occur
 - 4d. the RSR-72 go in STANDBY mode, and the LED blink at rate 1/1
5. After operation of item 4 in case of lack and recovery of the supply voltage, the motor automatic restart doesn't occur
6. In case of pushing of the "PA" push-button (STOP) during the count of re-start time (operation of item 3b)
 - the memory is deactivated;
 - the "R" contact does not close and the motor automatic restart does not occur
 - the RSR 72 go in STANDBY mode, and the led blink at rate 1/1.
7. Each "NC" contact placed directly in series to "PA" pushbutton carries out the same function of "PA" push-button
8. Each "NO" contact placed directly in parallel to "PM" pushbutton carries out the same function of "PM" push-button.
